238P: Operating Systems

Lecture 7: System boot

Anton Burtsev January, 2017

Outline for today

Boot operating system

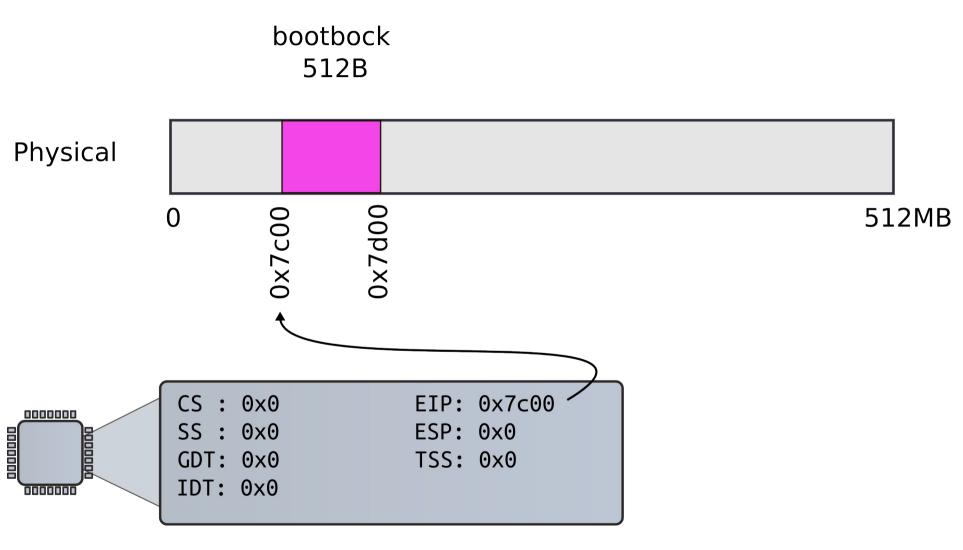

- Setup segments (data and code)
- Switch to protected mode
 - Load GDT (turn segmentation on)
- Setup stack (needed to call C functions)
- Load the kernel from disk into memory
- Setup first page table
 - 2 entries [0:4MB] and [2GB:(2GB+4MB)]
- Setup high-address stack
- Jump to main()
 - Start executing kernel code

What happens when we turn on the power?

- Well it's complicated
 - Intel SGX Explained is a good start (Section 2.13 [1])
- At a high-level a sequence of software pieces initializes the platform
 - Microcode, firmware (BIOS), bootloader

- The most important thing, the OS is not the only software running on the machine
 - And not the most privileged
- Today, at least two layers sit underneath the OS/hypervizor
 - System Management Mode (SMM) (ring -2)
 - Runs below the hypervisor/OS
 - Intel Management Engine (ring -3)
 - Runs on a separate CPU

Bootloader starts

Real Mode

Bootloader starts

```
9111 start:
9112 cli # BIOS enabled interrupts; disable
9113
9114
       # Zero data segment registers DS, ES, and
                                            SS.
       xorw %ax, %ax # Set %ax to zero
9115
9116
       movw %ax, %ds # -> Data Segment
9117
       movw %ax, %es # -> Extra Segment
9118
       movw %ax, %ss # -> Stack Segment
```

Why start happens to be 0x7c00?

```
9111 start:
9112 cli # BIOS enabled interrupts; disable
9113
                                    bootbock
                                     512B
                    Physical
                                         0x7d00
                             0
                                   0x7c00
                                                                      512MB
                              CS: 0x0
                                            EIP: 0x7c00
                              SS: 0x0
                                            ESP: 0x0
                              GDT: 0x0
                                            TSS: 0x0
                              IDT: 0x0
                              Real Mode
```

Linker are told so through the Makefile

```
9111 start:
9112 cli # BIOS enabled interrupts; disable
9113
bootblock: bootasm.S bootmain.c
        $(CC) $(CFLAGS) -fno-pic -O -nostdinc -I. -c bootmain.c
        $(CC) $(CFLAGS) -fno-pic -nostdinc -I. -c bootasm.S
        $(LD) $(LDFLAGS) -N -e start -Ttext 0x7C00 -o bootblock.o
bootasm.o bootmain.o
        $(OBJDUMP) -S bootblock.o > bootblock.asm
        $(OBJCOPY) -S -O binary -j .text bootblock.o bootblock
        ./sign.pl bootblock
```

Switch to protected mode

- Switch from real to protected mode
 - Use a bootstrap GDT that makes virtual addresses map directly to physical addresses so that the effective memory map doesn't change during the transition.

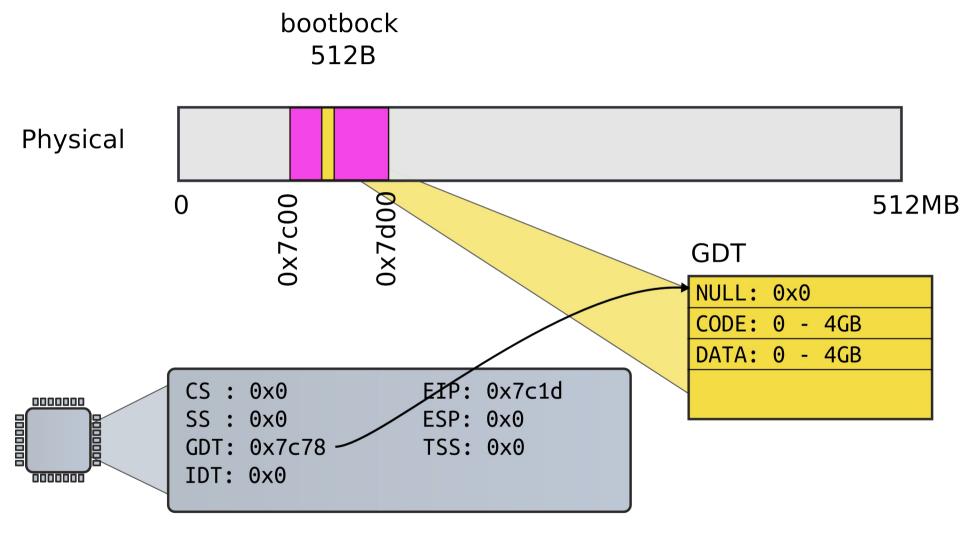

```
9141 lgdt gdtdesc

9142 movl %cr0, %eax

9143 orl $CRO_PE, %eax

9144 movl %eax, %cr0
```

Load GDT

Real Mode

How GDT is defined

```
9180 # Bootstrap GDT
9181 .p2align 2 # force 4 byte alignment
9182 gdt:
      SEG NULLASM # null seg
9183
9184 SEG ASM(STA X|STA R, 0x0, 0xffffffff) # code seg
9185 SEG ASM(STA W, 0x0, 0xffffffff) # data seg
9186
9187 gdtdesc:
9188 .word (gdtdesc - gdt - 1) # sizeof(gdt) - 1
9189 .long gdt
```

How GDT is defined

```
9180 # Bootstrap GDT
9181 .p2align 2 # force 4 byte alignment
9182 gdt:
      SEG NULLASM # null seg
9183
9184 SEG ASM(STA X|STA R, 0x0, 0xffffffff) # code seg
9185 SEG ASM(STA W, 0x0, 0xffffffff) # data seg
9186
9187 gdtdesc:
       .word (gdtdesc - gdt - 1) # sizeof(gdt) - 1
9188
9189 .long gdt
```

Actual switch

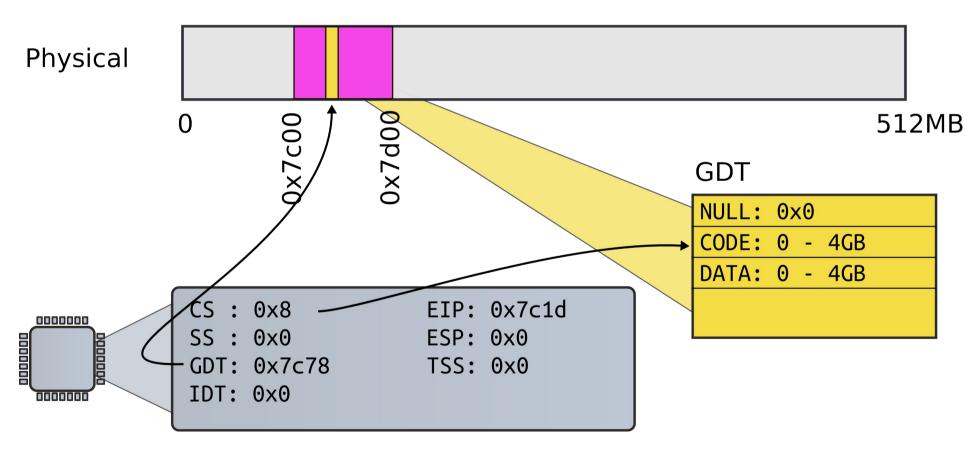

Use long jump to change code segment

```
9153 ljmp $(SEG_KCODE<<3), $start32
```

- Explicitly specify code segment, and address
- Segment is 0b1000 (0x8)

Long jump

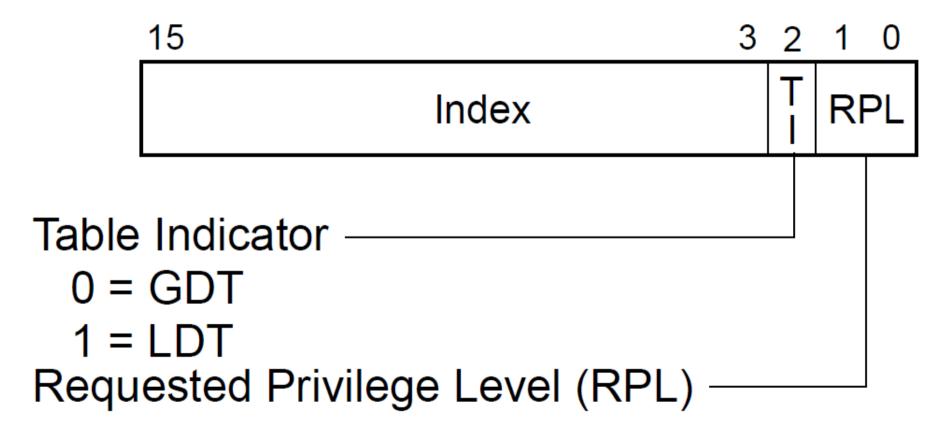

bootbock 512B

Protected Mode

Why CS is 0x8, not 0x1?

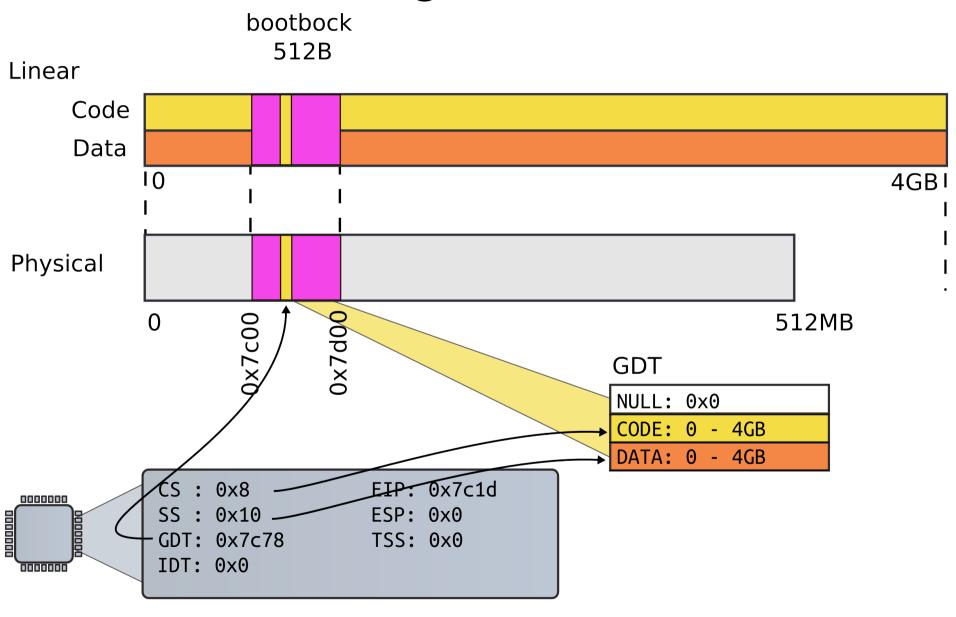

Segment selector:

Segments

```
9155 .code32 # Tell assembler to generate 32-bit code now.
9156 start32:
       # Set up the protected-mode data segment registers
9157
9158
      movw $(SEG_KDATA << 3), %ax # Our data segment selector
9159
      movw %ax, %ds # -> DS: Data Segment
9160
      movw %ax, %es # -> ES: Extra Segment
9161
       movw %ax, %ss # -> SS: Stack Segment
       movw $0, %ax # Zero segments not ready for use
9162
      movw %ax, %fs # -> FS
9163
      movw %ax, %gs # -> GS
9164
```

Segments

Protected Mode

Setup stack

Why do we need a stack?

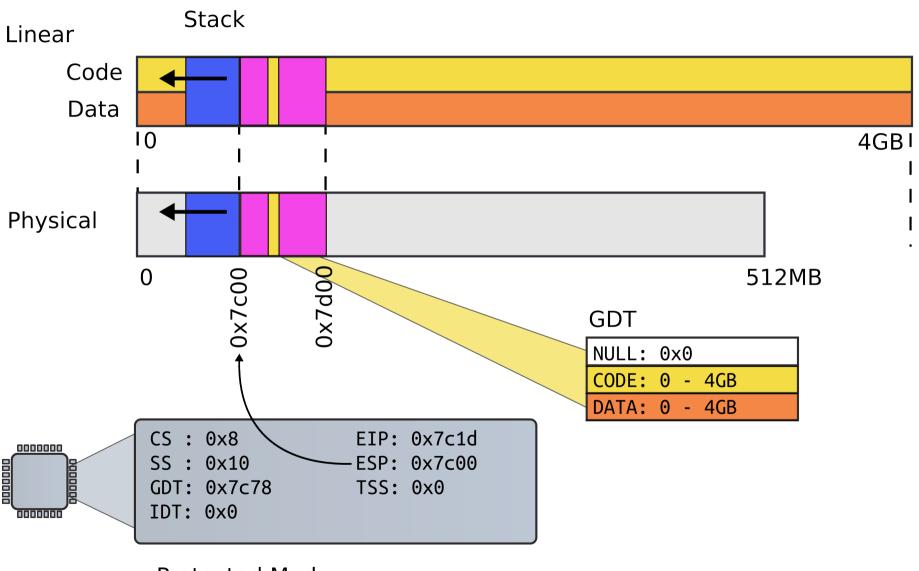

```
9166 movl $start, %esp
9167 call bootmain
```

Setup stack

- Need stack to use C
 - Function invocations
 - Note, there were no stack instructions before that

```
9166 movl $start, %esp
9167 call bootmain
```

First stack

Protected Mode

Invoke first C function

```
9166 movl $start, %esp
9167 call bootmain
```

```
bootmain(): read kernel
9216 void
9217 bootmain(void)
                                        from disk
9218 {
9219
        struct elfhdr *elf:
9220
        struct proghdr *ph, *eph;
9221
        void (*entry)(void);
9222
        uchar* pa;
9223
9224
        elf = (struct elfhdr*)0x10000; // scratch space
9225
9226
        // Read 1st page off disk
9227
        readseg((uchar*)elf, 4096, 0);
9228
9229
        // Is this an ELF executable?
9230
        if(elf->magic != ELF MAGIC)
9231
             return: // let bootasm.S handle error
9232
```

xv6/bootmain.c

```
9232
9233
         // Load each program segment (ignores ph flags).
9234
         ph = (struct proghdr*)((uchar*)elf + elf->phoff);
9235
         eph = ph + elf->phnum;
         for(; ph < eph; ph++){
9236
9237
             pa = (uchar*)ph->paddr;
9238
             readseg(pa, ph->filesz, ph->off);
9239
             if(ph->memsz > ph->filesz)
9240
                 stosb(pa + ph->filesz, 0, ph->memsz - ph->filesz);
         }
9241
9242
9243
         // Call the entry point from the ELF header.
9244
         // Does not return!
9245
         entry = (void(*)(void))(elf->entry);
9246
         entry();
                       bootmain(): read kernel
9247 }
                                     from disk
xv6/bootmain.c
```

```
How do we read disk?
9257
9258 // Read a single sector at offset into dst.
9259 void
9260 readsect(void *dst, uint offset)
9261 {
9262
       // Issue command.
       waitdisk();
9263
        outb(0x1F2, 1); // count = 1
9264
        outb(0x1F3, offset);
9265
9266
        outb(0x1F4, offset >> 8);
9267
        outb(0x1F5, offset >> 16);
9268
        outb(0x1F6, (offset >> 24) | 0xE0);
9269
        outb(0x1F7, 0x20); // cmd 0x20 - read sectors
9270
9271
        // Read data.
9272
        waitdisk();
9273
        insl(0x1F0, dst, SECTSIZE/4);
```

How do we read disk (cont)?

```
9250 void
9251 waitdisk(void)
9252 {
9253
         // Wait for disk ready.
         while((inb(0x1F7) & 0xC0) != 0x40)
9254
9255
9256 }
9257
```

xv6/bootmain.c

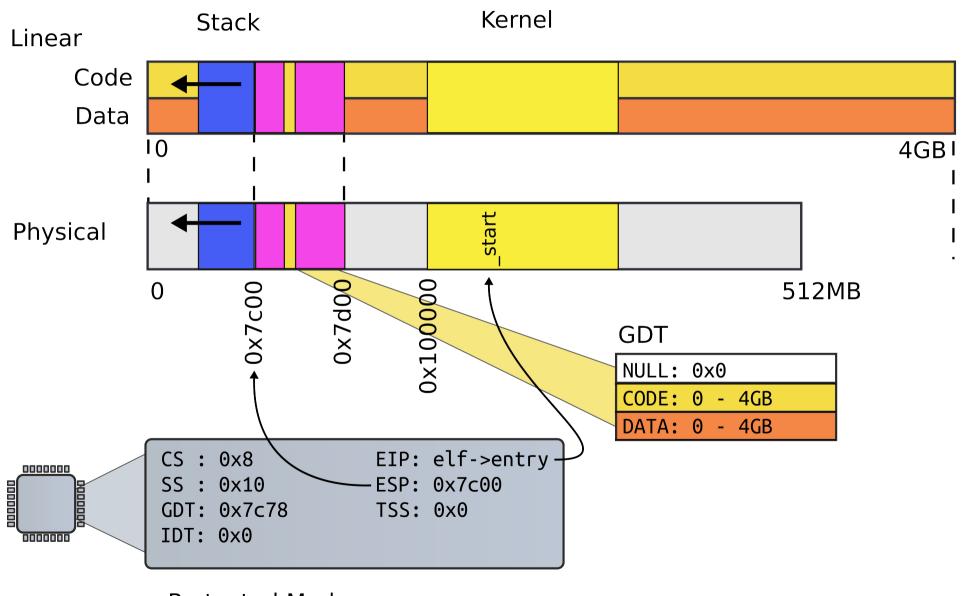

```
9232
9233
         // Load each program segment (ignores ph flags).
9234
         ph = (struct proghdr*)((uchar*)elf + elf->phoff);
9235
         eph = ph + elf->phnum;
9236
         for(; ph < eph; ph++){
             pa = (uchar*)ph->paddr;
9237
9238
             readseg(pa, ph->filesz, ph->off);
9239
             if(ph->memsz > ph->filesz)
9240
                 stosb(pa + ph->filesz, 0, ph->memsz - ph->filesz);
         }
9241
9242
9243
         // Call the entry point from the ELF header.
9244
         // Does not return!
9245
         entry = (void(*)(void))(elf->entry);
9246
         entry();
9247 }
                               Call kernel entry
```

xv6/bootmain.c

```
1039 .globl entry
1136 # By convention, the start symbol specifies the ELF entry point.
1137 # Since we haven't set up virtual memory yet, our entry point is
1138 # the physical address of 'entry'.
1139 .globl start
1140 start = V2P W0(entry)
1141
1142 # Entering xv6 on boot processor, with paging off.
1143 .globl entry
1144 entry:
1145 # Turn on page size extension for 4Mbyte pages
1146 movl %cr4, %eax
1147 orl $(CR4 PSE), %eax
1148 movl %eax, %cr4
```

entry(): kernel ELF entry

Kernel

Protected Mode

```
1039 .globl entry
1136 # By convention, the _start symbol specifies the ELF entry point.
1137 # Since we haven't set up virtual memory yet, our entry point is
1138 # the physical address of 'entry'.
1139 .globl start
1140 start = V2P W0(entry)
1141
1142 # Entering xv6 on boot processor, with paging off.
1143 .globl entry
1144 entry:
1145 # Turn on page size extension for 4Mbyte pages
1146 movl %cr4, %eax
1147 orl $(CR4 PSE), %eax
1148 movl %eax, %cr4
```

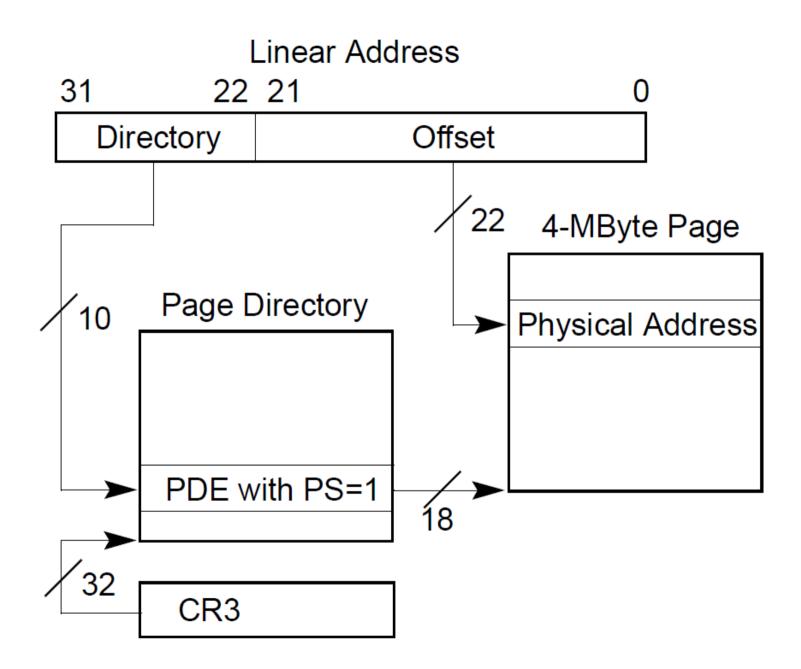

entry(): kernel ELF entry

Set up page directory

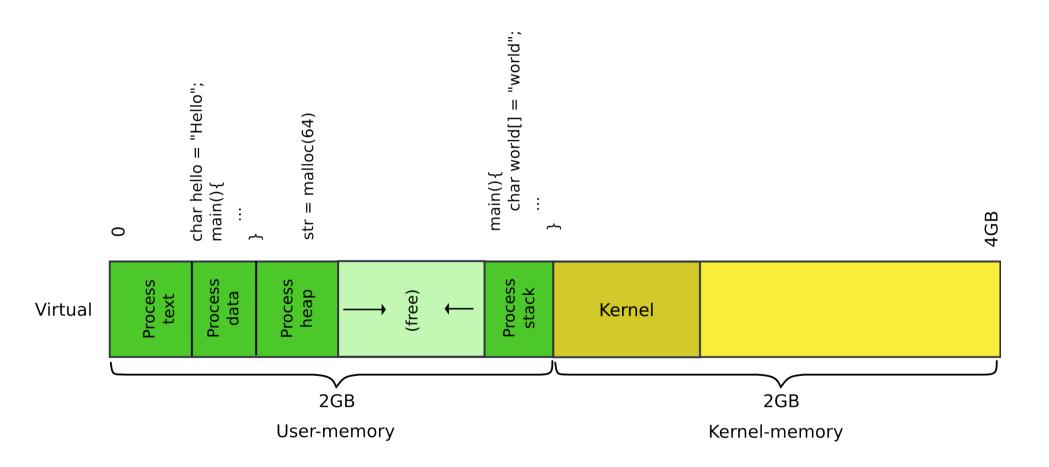

```
1149 # Set page directory

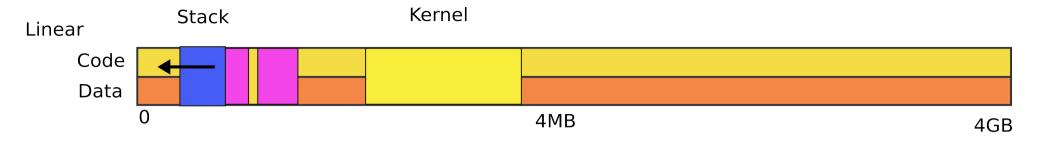

1150 movl $(V2P_WO(entrypgdir)), %eax

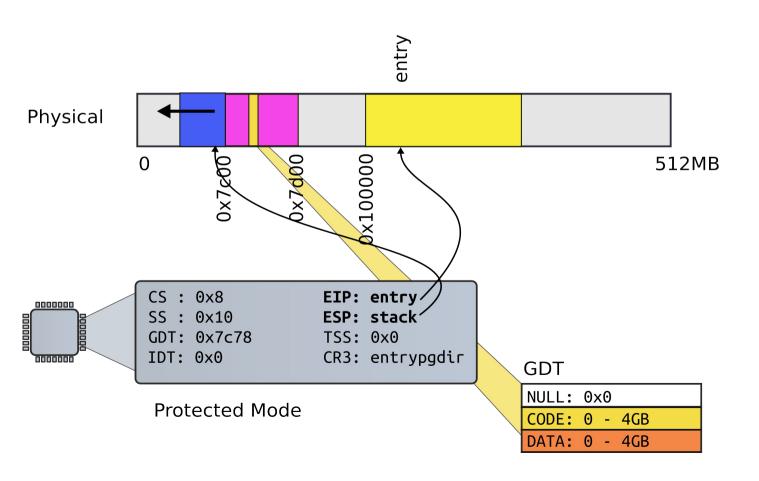

1151 movl %eax, %cr3
```

Our goal: 2GB/2GB address space

First page table

- Two 4MB entries (large pages)
- Entry #0
 - $0x0 4MB \rightarrow 0x0:0x400000$
- Entry #512
 - $0x0 4MB \rightarrow 0x8000000:0x80400000$

```
1406 // The boot page table used in entry. S and entryother. S.
1407 // Page directories (and page tables) must start on page
         boundaries,
1408 // hence the __aligned__ attribute.
1409 // PTE_PS in a page directory entry enables 4Mbyte
pages.
1410
1411 __attribute__((__aligned__(PGSIZE)))
1412 pde_t entrypgdir[NPDENTRIES] = {
1413
      // Map VA's [0, 4MB) to PA's [0, 4MB)
      [0] = (0) \mid PTE_P \mid PTE_W \mid PTE_PS,
1414
      // Map VA's [KERNBASE, KERNBASE+4MB) to PA's [0, 4MB)
1415
       [KERNBASE>>PDXSHIFT] = (0) | PTE_P | PTE_W | PTE_PS,
1416
                  First page table
1417 };
```

```
1406 // The boot page table used in entry. S and entryother. S.
1407 // Page directories (and page tables) must start on page
        boundaries,
1408 // hence the __aligned__ attribute.
1409 // PTE_PS in a page directory entry enables 4Mbyte
pages.
1410
1411 __attribute__((__aligned__(PGSIZE)))
1412 pde_t entrypgdir[NPDENTRIES] = {

1413 // Map VA's [0, 4MB) to PA's [0, 4MB)
      [0] = (0) \mid PTE_P \mid PTE_W \mid PTE_PS,
1414
      // Map VA's [KERNBASE, KERNBASE+4MB) to PA's [0, 4MB)
1415
      [KERNBASE>>PDXSHIFT] = (0) | PTE_P | PTE_W | PTE_PS,
1416
                  First page table
1417 };
```

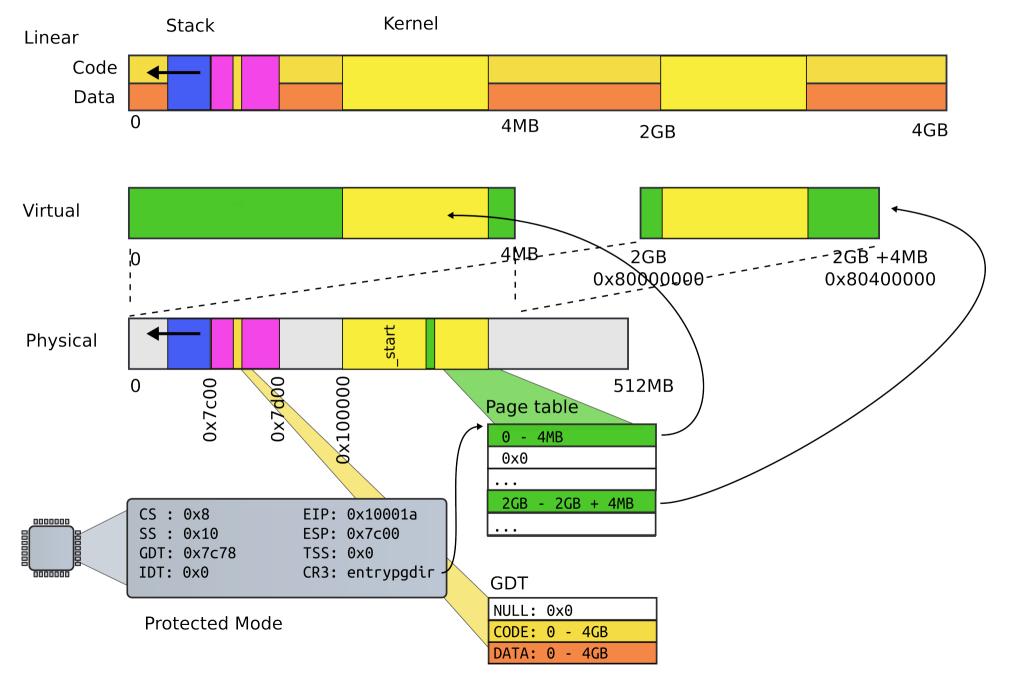

```
1406 // The boot page table used in entry. S and entryother. S.
1407 // Page directories (and page tables) must start on page
         boundaries,
1408 // hence the __aligned__ attribute.
1409 // PTE_PS in a page directory entry enables 4Mbyte
pages.
1410
1411 __attribute__((__aligned__(PGSIZE)))
1412 pde_t entrypgdir[NPDENTRIES] = {
1413 // Map VA's [0, 4MB) to PA's [0, 4MB)
      [0] = (0) \mid PTE_P \mid PTE_W \mid PTE_PS
1414
      // Map VA's [KERNBASE, KERNBASE+4MB) to PA's [0, 4MB)
1415
       [KERNBASE>>PDXSHIFT] = (0) | PTE_P | PTE_W | PTE_PS
1416
                  First page table
1417 };
```

```
1406 // The boot page table used in entry. S and entryother. S.
1407 // Page directories (and page tables) must start on page
         boundaries,
1408 // hence the __aligned__ attribute.
1409 // PTE_PS in a page directory entry enables 4Mbyte
pages.
1410
1411 __attribute__((__aligned__(PGSIZE)))
1412 pde_t entrypgdir[NPDENTRIES] = {
1413 // Map VA's [0, 4MB) to PA's [0, 4MB)
      [0] = (0) \mid PTE_P \mid PTE_W \mid PTE_PS,
1414
      // Map VA's [KERNBASE, KERNBASE+4MB) to PA's [0, 4MB)
1415
1416 [KERNBASE>>PDXSHIFT] = (0) | PTE_P | PTE_W | PTE_PS,
                  First page table
1417 };
```

First page table (cont)

```
0870 // Page directory and page table constants.
0871 #define NPDENTRIES 1024
```

First page table

Turn on paging

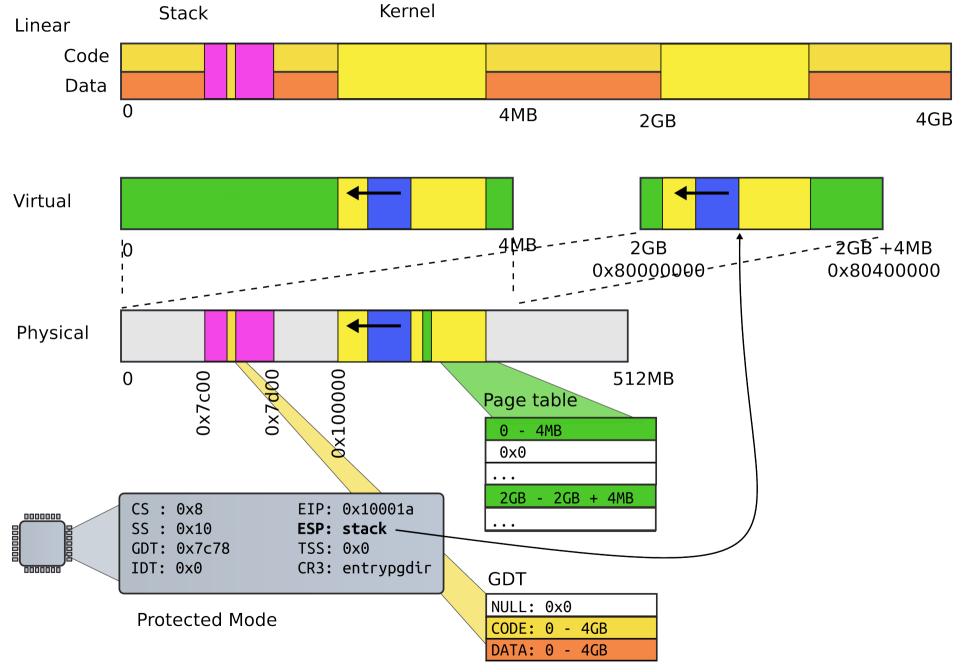

```
1152 # Turn on paging.
1153 movl %cr0, %eax
1154 orl $(CRO_PG|CRO_WP), %eax
1155 movl %eax, %cr0
```

High address stack (4K)

```
1157 # Set up the stack pointer.
1158 movl $(stack + KSTACKSIZE), %esp
1159
...
1167 .comm stack, KSTACKSIZE
```

0151 #define KSTACKSIZE 4096 // size of per-process kernel stack

High address stack (4K)

Jump to main()

```
1160 # Jump to main(), and switch to executing at
1161 # high addresses. The indirect call is
       needed because
1162 # the assembler produces a PC-relative
       instruction
1163 # for a direct jump.
1164 mov $main, %eax
1165 jmp *%eax
1166
```

Running in main()

```
1313 // Bootstrap processor starts running C code here.
1314 // Allocate a real stack and switch to it, first
1315 // doing some setup required for memory allocator to work.
1316 int
1317 main(void)
1318 {
1319
         kinit1(end, P2V(4*1024*1024)); // phys page allocator
1320
         kvmalloc(); // kernel page table
1321
        mpinit(); // detect other processors
1322
         lapicinit(); // interrupt controller
1323
         seginit(); // segment descriptors
         cprintf("\ncpu%d: starting xv6\n\n", cpunum());
1324
1340 }
```

Recap of the boot sequence

- Setup segments (data and code)
- Switched to protected mode
 - Loaded GDT (segmentation is on)
- Setup stack (to call C functions)
- Loaded kernel from disk
- Setup first page table
 - 2 entries [0:4MB] and [2GB:(2GB+4MB)]
- Setup high-address stack
- Jumped to main()

Conclusion

- We've booted
 - We're running in main()

- Next time:
 - Process and kernel address space

Thank you!
